

mergeConfigFile

Introduced in	
Version:	1.18
Description	
Description:	Merges the given configuration file with the main configuration.
Syntax	
Syntax:	<code>mergeConfigFile [configfile, userdir]</code>
Parameters:	<ul style="list-style-type: none">• configfile: String - File name.• userDir: Boolean - If true, the location is relative to the user profile directory (typically, in Documents). If false, the file is loaded from the current mission directory (default: true).• absoluteDir: Boolean - If true, the file location is given as an absolute path (for example, <code>C:\config.cpp</code>). If the passed file name contains a drive letter (ex: <code>C:\</code>), it is treated as an absolute path regardless of the values for userDir and absoluteDir.
Return Value:	Nothing
Examples	
Examples:	<code>mergeConfigFile ["myconfig", false]</code>
